TEST CASE MANAGER · DOCUMENTATION

Test Case status cycle

What each status means, who moves a Test Case forward and when the system moves it for you.

The expected flow

In Fixes

Some device failed. After the fix, a new pull request sends the case back to In Review.

Excluded

From any status, when the case cannot be automated. It keeps its results and history.

What each status means

Status	Meaning
To-Do	Every new Test Case starts here.
In Progress	The developer started working on it.
In Review	The pull request was sent.
In Validation	The pull request was approved; the case waits for Form Factor results.
Done	Every device of the project passed.
In Fixes	Some device failed; a fix is on the way.
Excluded	The case cannot be automated.

Who moves a Test Case

Administrator, manager, KP

Move any case within their scope.

Main assignee

Moves their own cases, to any status.

Backup

Can only move the case to Excluded.

Everyone else

Only reads.

Change the status in the Test Cases table or drag the card on the Board. **Move to** on each card does the same without a mouse.

Only In Validation moves by itself.

In every other status, a person moves the case. Results still go to the history.

When results arrive

From an SDF report or a test round, for a case in In Validation:

Latest result of every device is PASS

→ Done

The result that just arrived is FAIL

→ In Fixes

Anything else, such as a device still without a result

Stays

Values other than PASS or FAIL, such as N/A, never change the status.

Excluding a Test Case

1. Moving a case to Excluded asks for a justification of up to 500 characters.
2. Anyone who sees the case reads it with **View justification** in the Notes column.
3. If the case leaves Excluded, the justification is cleared. A new exclusion asks for a new one.

Code done and End date

Code done

The first time the case entered In Review.

End date

The date of the run that completed PASS on every device of the project.

- The system sets both dates once, and nobody edits them.
